

Sepson Consep

– Remote control with all features

The universal remote control system controls the entire vehicle's hydraulics. The control unit, wireless or cable connected or combined, is easy to use with both proportional and digital outputs. The remote unit can start the engine and adjust the engine speed to operate the hydraulic systems. It can turn on hazard lights and elevate the light ramp and also position support legs, boom and underlift. And not the least, it can operate all winches. The available field busses include CAN-Open, J1939 and SEPSON CAN.
